Amazing Healing with Ultrasound

Dentists and patients report amazing healing with ultrasound

29th November 2010

Inhibits growth of harmful bacteria: Micro-cleaning with ultrasound

“As treatment was not producing the required results, I gave my patient the new ultrasonic toothbrush for her dental care. Within a few days, my patient was free of pain and dental complaints for the very first time”.

Dr. Sebastian Kaul is one of many dentists, who reported amazing results using this new ultrasound technology for oral hygiene and dental care. This technology has been developed and patented by a specialized company in the federal state of Hessen / Germany.

Kaul, “A patient complained of continual, chronic, pulsating pain, with bleeding in the upper second Quadrant (upper, left side). I replaced the bridge with implants. The problem did not disappear. Further neurological examinations did not produce the required results. I finally recommended the use of the new ultrasound toothbrush, Emmi-dental Professional. After a few days of using this new technology, 95% of the symptoms were eliminated. I assume the ultrasound treatment increases the blood circulation in the gums, which in turn accelerates the

healing process. The ultrasound waves which work at 96 million waves per minute, inhibit the growth of harmful bacteria and all this helps in the healing process.

Since the company Sebapharma introduced the ultrasound toothbrush, Emmi-dental Professional (manufactured by EMAG AG), in pharmacies nationwide, enthusiastic reports by users about the positive impact of ultrasound on gingivitis, mouth ulcers, bad breath (halitosis) and periodontitis have escalated.

“My problems of gingivitis are practically non-existent. When I visited my dentist for some prophylactic treatment, he could only find minimal plaque,” wrote patient Irene Schwalb to the manufacturer.

“The gums around my wisdom teeth were often tender and swollen”, e - mailed Antonio Perrone. “The ultrasound toothbrush helped to heal my painful gums. The swelling disappeared after a few days and I was free of pain. I am enthusiastic about this new toothbrush and I will use it to prevent inflammation, paradontosis and bleeding from the gums”.

A further report came from dentist Dr. Mike C. Zaeuner from Bad Homburg, Germany “My wife suffered from acute gingivitis, exacerbated by a painful aphthous ulcer. Considering the diagnosis, I tested the use of the Emmi-dental Professional ultrasound toothbrush, as a therapy, to discover the difference from other conventional therapies. The application began at a stage of profound inflammation, at which the planned treatment could not be started. With regular use of the ultrasound toothbrush, the symptoms disappeared within 2 to 3 days. I was surprised to see how the healing process began within a short time. For me, this was the ultimate test of the ultrasound toothbrush. I am going to test this new technology in the treatment of other indicated areas”.

In blogs and chats, increasing levels of discussion regarding the use of this new ultrasound toothbrush at home have been seen. Some believe that the manufacturer’s claims are a brilliant marketing strategy and are critical about the use of this technology. This also applies to dentists who have not yet discovered the positive consequences of using the Emmi-dental Professional ultrasound toothbrush to complement their dental treatments.

The manufacturer EMAG AG substantiates their claims with the fact that ultrasound creates millions of micro bubbles with a special ultrasound toothpaste, which due to their microscopic size, penetrate the smallest gaps between the teeth, in grooves and gum pockets and remove residuum, plaque, bacteria, etc. This has been verified by the University of Frankfurt, with the use of an Electronic Raster Microscope. Ultrasound also has a prophylactic and therapeutic effect, due to the fact that ultrasound kills bacteria and germs on the outside and inside of the teeth and gums. It is effective on the gums, as ultrasound penetrates approx. 12 mm deep into the tissues and extirpates bacteria and inflammation at the periodontal and root areas of the teeth. “By increasing blood circulation in the tissues and by the release of the body’s own energies, the immune system and thus the body’s own power of resistance are significantly strengthened, which in turn leads to an acceleration of the healing process”, the manufacturer EMAG AG explains.

Scientific studies and practical tests being performed in Germany and abroad will explore and document the amazing impact of this new method of real ultrasound cleaning on dental hygiene. This must not be confused with commercially available 'sound brushes'. Results are expected in the first quarter of 2011.

Many users, who are now successfully using the new ultrasound toothbrush, are only interested in results with regular, daily use. For example, Kristina Krajnovic from Buettelborn (38) filed this detailed report, "Since a child, I have always had good and healthy teeth. My dentist, whom I visit twice a year, confirms that my teeth are in excellent condition, as I have always looked after my teeth conscientiously.

One day I woke up with an unbearable toothache. A visit to my dentist confirmed an inflammation at the root area and the tooth would have to be extracted. This predicament may have made me cancel a well earned trip to Turkey. Neither the use of my electronic toothbrush nor pain killers could alleviate the discomfort. Finally, a colleague suggested trying the new ultrasound toothbrush, as this helps heal inflammation at the tooth root. I immediately bought one and started to use it. On arrival in Turkey, at the start of my holiday, I only had minimal discomfort and within a few days I was pain free. Three months later, at a routine dental check-up, my dentist was amazed to find nothing wrong with the tooth, which four months earlier was nearly extracted, my gums or the tooth root. I once again have healthy, bright teeth. I will never buy another toothbrush. I am very confident that this ultrasound toothbrush will keep my teeth healthy and such a nasty surprise will not happen again".
